

Ashton Honnecke

Senior Software/Cloud Engineer • Python • AWS • DevOps

mailto:published_cv@cxcs.us | <https://ashton.honnecke.us> | <https://www.linkedin.com/in/ashtonhonnecke/> | <https://github.com/ahonnecke/> | Denver, CO

Highlights

- Self-motivated engineer focused on maintainable, reusable code and pragmatic delivery.
- Operates comfortably from low-level systems detail to high-level business outcomes.
- Clear communicator (written & verbal); results-driven and collaborative.
- Experience running/serving extremely high-scale, public-facing web properties.
- Speaker: PyColorado — [Cleaning Up Your Python Environment: Superfund Site](#).
- Speaker: PyDEN — [The Value of Linting](#).

Experience

CrewCapable AI - Chief Technology Officer (2025-Present)

Subject Matter Expert: TypeScript, Python, Next.js 15, React 19, AWS CDK, Lambda, Step Functions, Postgres/Supabase, LLM extraction, Zod, Vitest, LocalStack, EDI X12

- Greenfield SaaS for corrugated packaging purchase-order intake: OCR + LLM extraction + human-in-the-loop review + automated ERP/EDI export; production pilot in under 10 months.
- Serverless AWS architecture on CDK: Lambda functions and a Step Functions workflow orchestrating OCR/extraction/reconciliation; event-driven integration across S3, Textract, EventBridge, SNS, Secrets Manager.
- Split infrastructure into four independently deployable CDK stacks (core backend, audit, ERP, management) to isolate blast radius and enable per-tenant rollout.
- Next.js 15 / React 19 frontend over a typed API layer; Postgres (Supabase) with row-level security on every tenant-scoped table.
- Multi-provider LLM document-extraction pipeline (OpenAI, Gemini, Mistral, Tesseract, Textract) with Zod-typed schemas; immutable audit trail separating raw model output from human-reviewed values.
- Document-processing state machine handling PDF, DOCX, image, and email-attachment intake with explicit failure and timeout paths.
- Test suite spanning Vitest unit tests, Testing Library, LocalStack integration, and ERP golden-file contract tests; CI covering type checks, migration linting, and ERP regression.
- Strict end-to-end type safety: branded domain types, Zod validation at every boundary, generated Supabase types; Biome + ESLint + Ultracite enforced in CI.
- Forward-only Postgres migrations with automated migration linting in CI to prevent environment drift.
- Per-Lambda CloudWatch alarms, state-machine failure alerts, commit-SHA logging on Lambda cold start, /api/version endpoint for incident-to-revision traceability.
- AWS Secrets Manager + per-Lambda IAM scoping + RLS on every customer-data table — no shared service accounts across tenants.
- Production integrations: Amtech DAT (SFTP), Epicor P21, QuickBooks, outbound X12 850 EDI; Stripe billing, Supabase Auth with Google OAuth, PostHog analytics, SES-based email intake.
- Turborepo / pnpm monorepo spanning web, backend, and shared packages with a single-concern file layout.

Panasonic North America - Lead Cloud Engineer (2020-2025)

Subject Matter Expert: Python, boto3, Bash, AWS (Lambda, SQS, SNS, Fargate, S3, CloudWatch, Cost Explorer), SonarQube, Docker, V2X/OBU telematics, SAE J2735 (DSRC), edge devices

- Chaired cross-team best-practices workgroup (~50 engineers) on OO, SOLID, code quality, and security; mentored developers across the org.
- Authored ADRs for event-driven/serverless and long-running serverful (Fargate) cloud-native architectures.
- Authored end-to-end incident playbooks: classification → response → resolution → blameless post-mortem.
- Built a near-real-time OBU ingress pipeline on Lambda/SQS/SNS with horizontal scale; worked with SAE J2735 DSRC messages in the data path; provisioned for throughput headroom not exercised in production.
- Shipped V2X messaging deployment for a Utah snowplow fleet; worked on edge devices, packet sniffing, and hardware↔cloud integration.
- Designed and released internal developer tooling as open-source on PyPI: hot Lambda filesystem mounting (Console), CLI SNS inspection (Snifter), Jira↔Git forge integration (Jolly Brancher).
- Delivered artifact build pipeline reducing build time and cost.
- Identified and decommissioned unused AWS resources via Cost Explorer and tagging discipline → up to ~30% infrastructure savings.
- Drove self-hosted SonarQube rollout across the org → >50% unit-test coverage gains across multiple languages.

Digital Assets Data - Sr. Software Engineer / Blockchain Tech Lead (2018-2020)

Subject Matter Expert: Python, Django, React, Pandas, Docker, AWS (Lambda, API Gateway, S3, CloudWatch, ECS), RabbitMQ, Google BigQuery, CircleCI, BTC/ETH nodes, smart contracts

- Built Python microservices to extract on-chain BTC/ETH data directly from cloud-hosted nodes (low-latency ingest; pandas; scheduled CloudWatch Events).
- Stood up and operated a RabbitMQ message broker for asynchronous, decoupled service-to-service messaging across the ingestion services.
- Implemented Lambda + API Gateway microservices for cryptographic decoding at very high throughput.
- AWS ingestion pipelines on S3, CloudWatch Events, Lambda, and ECS — processed 100 GB nightly with individual files up to 30 GB.
- Worked with Google BigQuery to extract, normalize, and ingest Bitcoin and Ethereum datasets.
- Implemented QR-code TOTP multi-factor authentication in Django/React; hardened and containerized blockchain nodes across per-env configurations.
- "Fan-out" CircleCI workflows to parallelize PR tests; standardized unit testing + linting; containerized every stack with Docker.
- Automated external-library dependency PRs with integration checks against external APIs in the PR test flow only.
- Tech lead with 1 direct report (blockchain team of 2 at peak); owned on-call playbooks (VictorOps, OpsGenie); performed many interviews.
- Built centralized unhandled-exception capture/logging and uptime monitoring across multiple projects and languages.
- Restructured deploys into a single "push-button" script; wrote and distributed git hooks for linting, typing, and stylistic cohesion.

Havenly - Senior Software Engineer (2015-2017)

Subject Matter Expert: PHP, CakePHP 2/3, Linux, Git, SQL, queued-ingest systems, data modeling

- Most senior engineer on the data-ingest initiative within an ~8-person team; designed and shipped a greenfield,

horizontally scalable queued data-feed system: 7M+ rows/day from 25+ sources in 15 formats.

- Built decoupled pipeline: raw retention (traceability/replay) → transform/validate/store → push to external API with faceted fuzzy search.
- Authored CakePHP2 → CakePHP3 migration plan; refactored into OO Components and Behaviors (CakePHP's mix-ins/traits) to enable encapsulation and unit testability.

Colorado State University Global Campus - Systems Architect (pro tem) (2014-2015)

Subject Matter Expert: Linux, PHP, SQL, data modeling, SDLC, pentesting, Git, SSH

- Covered a vacated architecture-leadership role at CSU Global (director-level scope); led 1 engineer, owned architecture and SDLC for student portal, course registration, and transcript systems.

Pixelstub Consulting - Founder (2009-Present)

Subject Matter Expert: Linux, PHP, JavaScript, SQL, SDLC, pentesting, Git, SSH, LLM extraction pipelines

- Founder of a long-running independent consultancy (profitable when actively engaged); broad tech-stack engagements across web, mobile, data, and DevOps.
- Built an LLM-driven image-to-structured-data pipeline for menu data ingestion (picture → structured records).

Photobucket - Software Engineer → Senior Software Engineer (2005-2009)

Subject Matter Expert: PHP, MVC frameworks, PayPal API, credit-card payments, trust & safety tooling, AJAX, CI, MySQL

- W-2 engineer at Photobucket during its peak-traffic era (widely reported as top-50 global web property, ~100M users); promoted SWE → Sr SWE based on full ownership of internal tooling.
- Built trust & safety reporting pipeline: tool that packaged offensive content and transmitted to the National Center for Missing & Exploited Children (NCMEC); contributed to multiple predator arrests via proactive law-enforcement integration.
- Owned payments (PayPal + credit-card processing, reconciliation) and account-management tooling used for legal/compliance archival.
- Created a Propel-like model code-generation system with unit tests; migrated raw PHP pages to an MVC framework for internal tools.
- Introduced CI and unit testing into the team's workflow; mentored engineers on design, flow, and integration.
- Built an AJAX-based status/exception display system for consistent UX, surfacing caught DB exceptions.

Skills

- Software development across multiple languages, frameworks, and stacks (~25 yrs).
- Linux/Unix administration (~20 yrs); DevOps (cloud & colo) (~10 yrs).
- Startups (founder & early-stage) (~15 yrs), including profitable exits or profitability (~10 yrs).
- AI/LLM-native engineering (production LLM extraction pipelines, agent-directed development, multi-provider orchestration) (~1 yr production, ongoing).
- Blockchain (ETH/BTC nodes, data engineering) (~2 yrs).

Speaking

Profiles

- <https://github.com/ahonnecke>
- <https://www.linkedin.com/in/ashtonhonnecke/>

FOSS Utilities

Console

- Hot-mount Lambda filesystems for rapid iteration; "hot reloading."
- <https://pypi.org/project/console/>

Snifter

- Fast SNS topic/message inspection from the CLI.
- <https://pypi.org/project/snifter/>

Jolly Brancher

- Git/Jira helper: find tickets, create matching branches, enforce branch hygiene.
- <https://pypi.org/project/jolly-brancher/>

Education

Master of Business Administration — University of Denver (2002-2004)

- Emphasis: Accounting

Bachelor of Computer Science — University of Denver (1999-2003)

- Minors: Mathematics, Philosophy

Selected Projects / Community

Burning Man

- Art car (2015): <https://biodieseldirigible.honnecke.us/?c=big-wheel>
- "Places" installation (2015): <https://biodieseldirigible.honnecke.us/?c=homura-sansui>

Interests

I enjoy snowboarding, cooking, board games, reading, welding, electric bass, and a steady stream of hands-on projects. I love puzzles and problem-solving and contribute to open-source projects.
